

Unit 13 – House Styles & Interactive Components

House style (P3)

Colours	Background: The background colour is going to be simple but effective. Heading: The heading is going to be in a colour which stands out to the rest of the website. Sub-Heading: The sub-heading is going to be the next thing the people see after the title so it's going to be in a similar colour to the heading. Normal Text: The normal text is just going to be in all black so it's easy to understand. Footer: The footer is going to be in a simple colour because it's at the end of the page.
Fonts Type	Heading: The font type for the heading is going to be simple so that it's easy for people to read and see what it says. Sub-Heading: The sub-heading font type is going to be the same as the heading because it will be easy to understand. Normal Text: The normal text font is going to be different to the heading and the sub-heading, it's going to be simple to read and easy to follow. Footer: The footer is going to be in a different font to the normal text because it's at the bottom of the page.
Font Sizes	Heading: The size of the heading is going to be bigger than the rest of the website because it's the first thing that people see when they go onto the page. Sub-Heading: The size of the sub-heading is going to be a little smaller than the heading because it's under the heading. Normal Text: The normal text is going to be a reasonable size throughout the site. Footer: The footer is going to be a bit smaller in size than the normal because it's at the bottom of the page.

How will you ensure that colour schemes and page styles will remain consistent throughout the website? (M2)

The way in which I will ensure that the colour schemes and the page styles will remain consistent throughout the website is by I will use a style sheet to look at the colours I have throughout the site.

How interactive components will be embedded, how will a google search bar make it easier for users to navigate the site? (M2)

JavaScript popup box

JavaScript popup box will make it easier to someone to use the site by coming up straight away so people know what's going on.

Google Map

Google maps will make it easier for users to find out where the shop is and if it's near them I will find and code and embed when I have done this it will make it better to use.

Google search bar

The google search bar will make it easier for users to navigate the site because it will make it easier to find what they are looking for on the site and instead of going through the whole site all they will have to do is type in the search bar what they want.
